Anterior Shoulder Instability
Surgical Repair Protocol
Dr. Mark Adickes

Introduction:
• This rehabilitation protocol has been developed for the patient following an arthroscopic anterior stabilization procedure. This procedure tightens the previously lax anterior capsule and thus the patient should avoid placing stress on this portion of the shoulder by avoiding external rotation. That being said, early passive range of motion in other planes is highly beneficial to enhance circulation within the joint to promote healing.

Goals of rehabilitation are to:
• Control pain and inflammation
• Regain normal upper extremity strength and endurance
• Regain normal shoulder range of motion
• Achieve the level of function based on the orthopedic and patient goals

The physical therapy is to begin post-op week #1. It is extremely important for the supervised rehabilitation to be supplemented by a home fitness program.

Important post-op signs to monitor:
• Swelling of the shoulder and surrounding soft tissue
• Abnormal pain, hypersensitive—an increase in night pain
• Severe range of motion limitations
• Weakness in the upper extremity musculature

Return to activity:
• It requires both time and regular clinic evaluation to safely and efficiently return to functional activity.
• Adequate strength, flexibility, and endurance are all necessary to return to high level function, all of which are addressed in this program.
• Functional evaluation including strength and range of motion testing are required to assess a patient’s readiness to return to sport.
• Return to intense activities following an arthroscopic anterior stabilization procedure requires both a strenuous strengthening and range of motion program along with a period of time to
allow for tissue healing. Symptoms such as pain, swelling, or instability should be closely monitored by the patient.

Dr. Mark Adickes

Phase 1: Week 1-3

Range of Motion:
• Passive to AAROM-in scapular plane
  o External rotation (conservative; relatively pain free)
  o Internal rotation
• Passive to AAROM
  o Flexion/Elevation
• Pendulum exercises
• Wand exercises—all planes within limitations
• Rope/Pulley (flex, scaption)
• Active elbow flexion/extension
• Manual stretching and Grade I-II joint mobs

Strength:
• Initiate submaximal/pain free isometrics—all planes
• Grip strengthening with putty or ball

Brace:
• Brace for 3 weeks or as noted by Dr. Adickes
• Brace removed to perform exercises above

Modalities:
• E-stim as needed
• Ice 15-20 minutes

Goals for Phase 1:
• Promote healing of tissue
• Gradual increase in ROM
• Control pain and inflammation
• Independent in HEP
• Initiate light muscle contraction
Dr. Mark Adickes

Phase 2: Week 3-6

Range of Motion:
• Continue with all ROM activities from previous phase
• **NO LIMITATIONS** on ER-avoid extreme end range ER or abduction
• Wand exercise- all planes
• Rope/Pulley (flex, abd, scaption)
• Manual stretching and Grade II-III joint mobs

Strength:
• Initiate UBE for warm-up activity
• Initiate IR/ER at neutral with tubing
• Initiate forward flexion, scaption, empty can
• Prone horizontal abduction, extension to neutral
• Sidelying ER
• Bicep and tricep strengthening
• Initiate scapular stabilizer strengthening

Brace:
• Discharge brace at week 3

Modalities:
• Ice 15-20 minutes

Goals for Phase 2:
• Gradual increase to full ROM
• Improve upper extremity strength and endurance
• Control pain and inflammation
• Normalize arthrokinematics
Dr. Mark Adickes

Phase 3: Week 6-12

Range of Motion:
• Continue all ROM activities from previous phases
• Posterior capsule stretch
• Towel internal rotation stretch
• Manual stretching and Grade II-III joint mobs to reach goal

Strength:
• Continue all strengthening from previous phases increasing resistance and repetitions
• UBE for strength and endurance
• Initiate isokinetic IR/ER at 45° abduction at high speeds
• Progress push-up from wall, to table, to floor
• Initiate ER with 90° abduction with tubing
• Progress overhead plyotoss for dynamic stabilization
• Progress rhythmic stabilization throughout range of motion
• Initiate lat pulldowns and bench press
• Progress PNF to high speed work
• Initiate plyoball figure 8 stabilizations

Modalities:
• Ice 15-20 minutes

Goals for Phase 3:
• Full painless ROM
• Maximize upper extremity strength and endurance
• Maximize neuromuscular control
• Normalize arthrokinematics
• Clinical examination with no impingement signs
Dr. Mark Adickes

**Phase 4: Week 12-24**

**Range of Motion:**
- Continue all ROM activities from previous phases
- Posterior capsule stretch
- Towel internal rotation stretch
- Grade III-IV joint mobs as needed to reach goal

**Strength:**
- Continue with all strengthening exercises from previous phases increasing weight and repetitions
- Continue total body work out for overall strength
- Initiate light plyometric program
- Initiate military presses in front of neck
- Initiate and progress sport specific and functional drills
- Initiate interval throwing program

**Modalities:**
- Ice 15-20 minutes as needed

**Goals for Phase 4:**
- Return to activity upper extremity strength and endurance
- Return to activity neuromuscular control and arthrokinematics
- Return to sports specific training/functional training
